

WaTrck - Add a New Project

Quick setup guide - only the parts that change per project

1. Landing page

Copy the current working landing-page code. Change only the PROJECT CONFIG block at the top:

```
DEFAULT_MESSAGE = "Project WhatsApp message"

PROJECT_ID = "Exact_Firestore_Project_ID"

WHATSAPP_CONVERSION_NAME = "Exact Contact conversion name"

LEAD_VALUE_ESTIMATE = 70 (or the value you want)

LEGACY_GOOGLE_ADS_SEND_TO = "WhatsApp direct Google Ads ID/label"

LEGACY_LEAD_FORM_GOOGLE_ADS_SEND_TO = "Lead-form direct Google Ads ID/label"
```

Do not change the global phone, saveToken endpoint, attribution TTL, or the Webflow form-success detection logic. The form listener stays the same; only its Google Ads send_to value comes from the top config. Keep WATRCK_DEBUG = true while staging.

All projects use the same domain, so no CORS change is needed. The same WhatsApp number also means no Meta/Chatwoot webhook change.

2. Google Ads

- Create the project's Contact, Qualified, and Closed conversion actions.
- Names must match exactly what WaTrck/Sales Sheet uses.
- Contact = Secondary. Qualified = Primary. Closed = Primary.
- Put the correct direct Google Ads IDs/labels for WhatsApp click and lead-form success in the landing-page config.

3. Sales Sheet

- Duplicate the clean project template tab.
- Rename the tab to the new project's TabName.
- Add one row to Config: TabName | Qualified conversion name | Closed conversion name.
- TabName must exactly match the sheet tab name.
- Keep _TEMPLATE out of Config.

4. Nothing else to create

Reuse the existing global Conversions Sheet, Adjustments Sheet, Apps Scripts, Cloud Scheduler jobs, Firebase functions, tokenIndex, and Firestore structure. Firestore creates the new project path automatically when the first valid record arrives.

5. Quick verification before stress testing

- Open the new landing page with a test GCLID.
- Click WhatsApp and confirm a click appears under projects/<PROJECT_ID>/clicks.
- Confirm the token is added to the WhatsApp message and the direct Google Ads click conversion still fires.
- Submit the Webflow form once and confirm the existing success detector fires its direct Google Ads conversion.
- Confirm the project is set up correctly in the Sales Sheet.

Per-project changes	No change
Landing PROJECT CONFIG	Firebase functions
Google Ads conversion actions	Global Conversions/Adjustments Sheets
Sales tab + Config row	Cloud Scheduler jobs
Direct Google Ads IDs/labels	Phone / Meta / Chatwoot / CORS
