

WaTrck - Firebase Deploy Guide

Use this when you have just opened Windows CMD and see:

```
C:\Users\pc>
```

1. Go to the WaTrck project folder

```
cd /d "D:\Real Estate Projects\Advanced Tracking System\New\WaTrck"
```

Your CMD prompt should now start with:

```
D:\Real Estate Projects\Advanced Tracking System\New\WaTrck>
```

2. Verify this is the Firebase project folder

```
dir firebase.json
```

If firebase.json is listed, continue. If not, stop - you are in the wrong folder.

3. Select the correct Firebase project

```
firebase use aida-muscat-wa-tracking
```

4. Set WaTrck's deployment discovery timeout

```
set FUNCTIONS_DISCOVERY_TIMEOUT=60
```

This is needed because WaTrck's index.js can take longer than Firebase's default 10 seconds to load.

5. Deploy exportsApi only

```
firebase deploy --only functions:exportsApi
```

If Firebase says you are not logged in

```
firebase login
```

After login, repeat the steps above.

Useful alternatives

Deploy all Firebase-managed functions:

```
firebase deploy --only functions
```

If 60 seconds still times out:

```
set FUNCTIONS_DISCOVERY_TIMEOUT=120
```
